

COLOUR CHANGE DURING REVERSE EMBROIDERY

Did you know this T8 function yet?

Did you know?

What?

During back stitching, the machine detects colour changes and indicates it with a short break.

Why?

The function prevents unintended back stitching to the previous colour.

Otherwise a manual colour change would have to be made. As there is no thread cutting, the threads on the other heads would have to be checked manually.

Requirements

Recent T8 software

No additional settings required.
